# Data Science Cheat Sheet

Python - Intermediate

# **KEY BASICS, PRINTING AND GETTING HELP**

This cheat sheet assumes you are familiar with the content of our Python Basics Cheat Sheet

- s A Python string variable
- i A Python integer variable
- f A Python float variable

- 1 A Python list variable
- d A Python dictionary variable

#### LISTS

- 1.pop(3) Returns the fourth item from 1 and
   deletes it from the list
- 1.remove(x) Removes the first item in 1 that is
   equal to x
- 1.reverse() Reverses the order of the items in 1
- 1[1::2] Returns every second item from 1,
   commencing from the 1st item
- 1[-5:] Returns the last 5 items from 1 specific axis

#### STRINGS

- s.lower() Returns a lowercase version of s
- s.title() Returns s with the first letter of every word capitalized
- "23".zfill(4) Returns "0023" by left-filling the string with 0's to make it's length 4.
- s.splitlines() Returns a list by splitting the string on any newline characters.
- Python strings share some common methods with lists
- s[:5] Returns the first 5 characters of s
- "fri" + "end" Returns "friend"
- "end" in s Returns True if the substring "end"
  is found in s

## RANGE

Range objects are useful for creating sequences of integers for looping.

- range(5) Returns a sequence from 0 to 4
- range (2000, 2018) Returns a sequence from 2000 to 2017
- range(0,11,2) Returns a sequence from 0 to 10,
   with each item incrementing by 2
- range(0,-10,-1) Returns a sequence from 0 to -9
  list(range(5)) Returns a list from 0 to 4

# DICTIONARIES

- max(d, key=d.get) Return the key that
   corresponds to the largest value in d
- min(d, key=d.get) Return the key that corresponds to the smallest value in d

## SETS

my\_set = set(1) - Return a set object containing
the unique values from 1

- len(my\_set) Returns the number of objects in
  my\_set (or, the number of unique values from 1)
- a in my\_set Returns True if the value a exists in my\_set

# **REGULAR EXPRESSIONS**

- import re Import the Regular Expressions module
  re.search("abc",s) Returns a match object if
- the regex "abc" is found in s, otherwise None
  re.sub("abc", "xyz", s) Returns a string where
  all instances matching regex "abc" are replaced
- LIST COMPREHENSION

by "xyz"

A one-line expression of a for loop

- [i \*\* 2 for i in range(10)] Returns a list of
  the squares of values from 0 to 9
- [s.lower() for s in 1\_strings] Returns the
  list 1\_strings, with each item having had the
  .lower() method applied
- [i for i in 1\_floats if i < 0.5] Returns the items from 1 floats that are less than 0.5

## FUNCTIONS FOR LOOPING

- for i, value in enumerate(1):
   print("The value of item {} is {}".
   format(i,value))
- Iterate over the list 1, printing the index location of each item and its value
- for one, two in zip(l\_one,l\_two):
   print("one: {}, two: {}".format(one,two))
- Iterate over two lists, 1\_one and 1\_two and print each value
- while x < 10:
  - x += 1
- Run the code in the body of the loop until the value of  ${\bf x}$  is no longer less than  ${\bf 10}$

## DATETIME

- import datetime as dt Import the datetime
   module
- now = dt.datetime.now() Assign datetime
   object representing the current time to now
- wks4 = dt.datetime.timedelta(weeks=4)
- Assign a timedelta object representing a timespan of 4 weeks to wks4

- now wks4 Return a datetime object representing the time 4 weeks prior to now
- newyear\_2020 = dt.datetime(year=2020, month=12, day=31) - Assign a datetime object representing December 25, 2020 to newyear\_2020
- newyear\_2020.strftime("%A, %b %d, %Y")
   -Returns "Thursday, Dec 31, 2020"
- dt.datetime.strptime('Dec 31, 2020',"%b
  %d, %Y") Return a datetime object
  representing December 31, 2020

#### RANDOM

- import random Import the random module
- random.random() Returns a random float
  between 0.0 and 1.0
- random.randint(0,10) Returns a random integer between 0 and 10
- random.choice(1) Returns a random item from the list 1

## COUNTER

- from collections import Counter Import the
   Counter class
- c = Counter(1) Assign a Counter (dict-like)
   object with the counts of each unique item from
   1, to c
- c.most\_common(3) Return the 3 most common
  items from 1

## TRY/EXCEPT

Catch and deal with Errors

- 1\_ints = [1, 2, 3, "", 5] Assign a list of
   integers with one missing value to 1\_ints
- l\_floats = []
  for i in l\_ints:
  - try:
  - 1\_floats.append(float(i))

    vcent:
  - 1\_floats.append(i)
- Convert each value of l\_ints to a float, catching and handling ValueError: could not convert string to float: where values are missing.
